

FME Flow

Automate workflows built in FME Form. Run them on a schedule or in response to triggers. Scale-up for big data tasks and foster collaboration.

Build workflows in FME Form and automate the flow of data by publishing to FME Flow or FME Flow Hosted.

Ingest and process data on the fly. Set schedules or create event-based automation workflows for real-time processing.

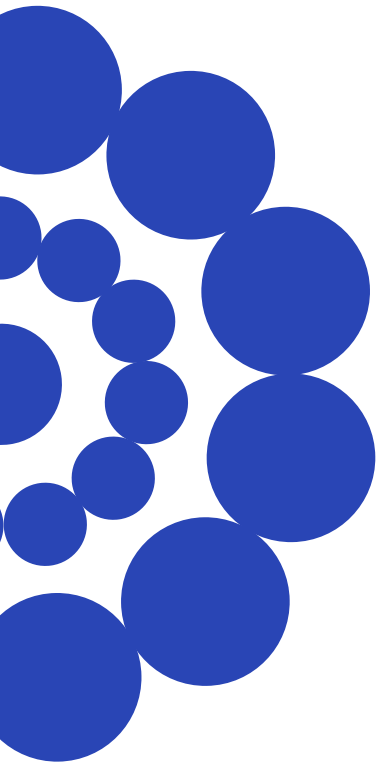

Build no-code web applications for data sharing.

It all starts with FME Form, then you add FME Flow.

FME Form is the authoring environment where you create your data transformation workflows.

Workflows define how data will be processed, validated, and transformed within FME Flow.

FME Flow, is the execution engine. It takes the pre-built workflows from FME Form and runs them on a schedule or response to a trigger.

Scale up processing power on demand by distributing jobs across multiple machines. Add more FME Engines to handle larger workloads. Run FME Flow anywhere you need it; on-premise, in the cloud (via FME Flow Hosted), or a hybrid environment.
